Analysis Report

Global dataset report

This report is the output of the Amazon SageMaker Clarify analysis. The report is split into following parts:

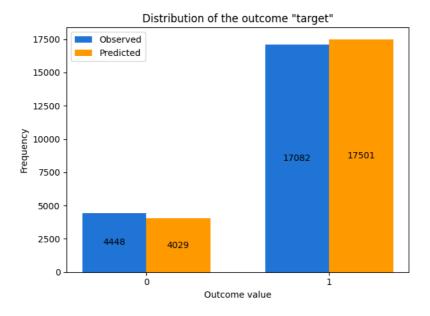

- 1. Analysis configuration
- 2. High level model performance
- 3. Pretraining bias metrics
- 4. Posttraining bias metrics
- 5. Model explanations

Analysis Configuration

Bias analysis requires you to configure the outcome label column, the facet and optionally a group variable. Generating explanations requires you to configure the outcome label. You configured the analysis with the following variables. The complete analysis configuration is appended at the end.

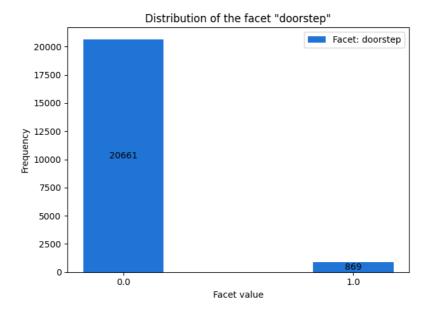

Outcome label: You chose the column target in the input data as the outcome label. Bias metric computation requires designating the positive outcome. You chose target = 1 as the positive outcome. target consisted of values [0, 1].

The figure below shows the distribution of values of target .

Facet: You chose the column doorstep in the input data as the facet. doorstep consisted of values [0.0, 1.0]. Bias metrics were computed by comparing the inputs doorstep = (0.0, 1.0] with all other inputs.

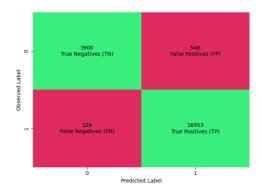

The figure below shows the distribution of values of doorstep .

High level model performance

Input data points can be divided into different categories based on their observed and predicted label. For instance, a False Negative (FN) is an input with a positive observed label (target = 1) but negative predicted label (target != 1). A True Negative (TN) is an input whose observed and predicted labels are both negative. True Positives (TP) and False Positives (FP) are defined similarly.

Based on the model predictions, the inputs can be divided into different categories as:

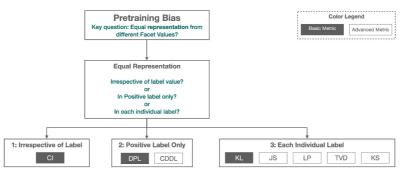

Here are metrics showing the model performance.

tion Value	Description	Metric
del. 0.969	Proportion of inputs assigned the correct predicted label by the model.	Accuracy
bel. 0.813	Proportion of input assigned in positive predicted label.	Proportion of Positive Predictions in Labels
abel. 0.187	Proportion of input assigned the negative predicted label.	Proportion of Negative Predictions in Labels
11 992	Proportion of inputs with positive observed label correctly assigned the positive predicted label.	True Positive Rate / Recall
0 8 / /	Proportion of inputs with negative observed label correctly assigned the negative predicted label.	True Negative Rate / Specificity
11 9n	Proportion of inputs with positive predicted label that actually have a positive observed label.	Acceptance Rate / Precision
บๆกล	Proportion of inputs with negative predicted label that actually have a negative observed label.	Rejection Rate
els. 0.976	Ratio between the positive observed labels and positive predicted labels.	Conditional Acceptance
oels. 1.104	Ratio between the negative observed labels and negative predicted labels.	Conditional Rejection
call. 0.980	Harmonic mean of precision and recall.	F1 Score

Pre-training Bias Metrics

Pretraining bias metrics measure imbalances in facet value representation in the training data. Imbalances can be measured across different dimensions. For instance, you could focus imbalances within the inputs with positive observed label only. The figure below shows how different pretraining bias metrics focus on different dimensions. For a detailed description of these dimensions, see <u>Learn How Amazon SageMaker Clarify Helps Detect Bias</u>.

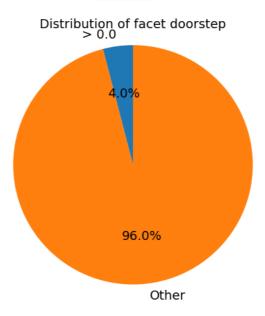

The metric values along with an informal description of what they mean are shown below. For mathematical formulas and examples, see the [Measure Pretraining Bias](https://docs.aws.amazon.com/sagemaker/latest/dg/clarify-measure-data-bias.html) section of the AWS documentation.

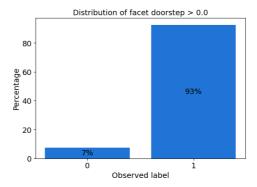

We computed the bias metrics for the label target using label value(s)/threshold target = 1 for the following facets:

• Facet column: doorstep

The pie chart shows the distribution of facet column doorstep in your data.

The bar plot(s) below show the distribution of facet column doorstep in your data.

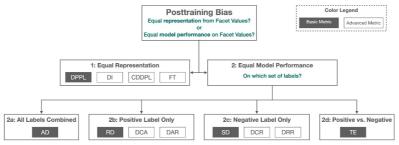

Facet Value(s)/Threshold: doorstep > 0.0

Metric	Description	Value	Error
Conditional Demographic Disparity in Labels (CDDL)	Measures maximum divergence between the observed label distributions for facet values doorstep > 0.0 and rest of the inputs in the dataset.	None	Error: see Clarify job output
Class Imbalance (CI)	Measures the imbalance in the number of inputs with facet values doorstep > 0.0 and rest of the inputs.	0.919	None
Difference in Proportions of Labels (DPL)	Measures the imbalance of positive observed labels between facet values $$ doorstep > $$ 0.0 $$ and rest of the inputs.	-0.137	None
<u>Jensen-Shannon</u> <u>Divergence (JS)</u>	Measures how much the observed label distributions of facet values $$ doorstep > 0.0 and rest of the inputs diverge from each other entropically.	0.020	None
<u>Kullback-Leibler</u> <u>Divergence (KL)</u>	Measures how much the observed label distributions of facet values doorstep > 0.0 and rest of the inputs diverge from each other entropically.	0.095	None
Kolmogorov-Smirnov (KS)	Measures maximum divergence between the observed label distributions for facet values doorstep > 0.0 and rest of the inputs in the dataset.	0.137	None
<u>Lp-norm (LP)</u>	Measures a p-norm difference between the observed label distributions associated with facet values doorstep > 0.0 rest of the inputs in the dataset.	0.194	None
Total Variation Distance (TVD)	Measures half of the L1-norm difference between the observed label distributions associated with facet values doorstep > 0.0 and rest of the inputs in the dataset.	0.137	None

Post-training Bias Metrics

.. . .

Posttraining bias metrics measure imbalances in model predictions across different inputs. The figure below shows how different posttraining metrics target different types of imbalances over inputs. For a detailed description of these types, see <u>Learn How Amazon SageMaker Clarify Helps Detect Bias</u>.

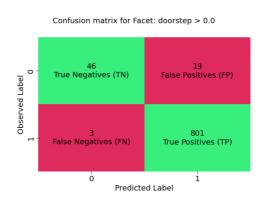

Bias can also result form imbalances in the model outcomes even when the facet value is not considered. The metric computing these imbalances is GE. The metric values along with an informal description of what they mean are shown below. For mathematical formulas and examples, see the [Measure Posttraining Data and Model Bias] (https://docs.aws.amazon.com/sagemaker/latest/dg/clarify-measure-post-training-bias.html) section of the AWS documentation.

We computed the bias metrics for the label target using label value(s)/threshold target = 1 for the following facets:

• Facet column: doorstep

Facet Value(s)/Threshold: doorstep > 0.0

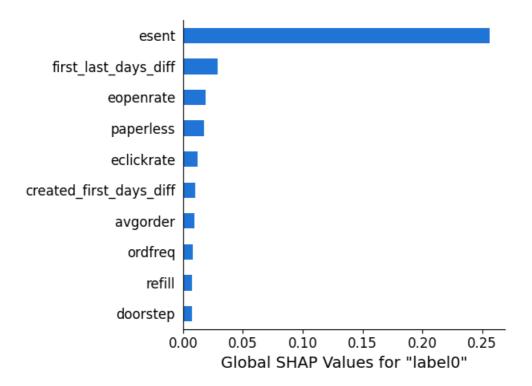

Metric	Description	Value	Error
Accuracy Difference (AD)	Measures the difference between the prediction accuracy for facet values $$ doorstep > $$ 0.0 $$ and rest of the inputs.	-0.006	None
Conditional Demographic Disparity in Predicted Labels (CDDPL)	Measures the disparity of predicted labels between facet values doorstep > 0.0 and rest of the inputs as a whole, but also by subgroups dictated by Age.	None	Error: see Clarify job output
Difference in Acceptance Rates (DAR)	Measures the difference in the ratios of the observed positive outcomes (TP) to the predicted positives (TP + FP) between facet values doorstep > 0.0 and rest of the inputs.	-0.009	None
Difference in Conditional Acceptance (DCAcc)	Compares the observed labels to the labels predicted by the model. Assesses whether this is the same across facet values doorstep > 0.0 and rest of the inputs for predicted positive outcomes (acceptances).	-0.005	None
Difference in Conditional Rejection (DCR)	Compares the observed labels to the labels predicted by the model and assesses whether this is the same across facet values doorstep > 0.0 and rest of the inputs for negative outcomes (rejections).	0.225	None
Disparate Impact (DI)	Measures the ratio of proportions of the predicted labels for facet values $$ doorstep > 0.0 $$ and rest of the inputs.	1.169	None
<u>Difference in Positive</u> <u>Proportions in Predicted</u> <u>Labels (DPPL)</u>	Measures the difference in the proportion of positive predictions between facet values doorstep > 0.0 and rest of the inputs.	-0.136	None
Difference in Rejection Rates (DRR)	Measures the difference in the ratios of the observed negative outcomes (TN) to the predicted negatives (TN + FN) between facet values doorstep > 0.0 and rest of the inputs.	-0.030	None
Counterfactual Fliptest (FT)	Examines each input with facet value doorstep > 0.0 and assesses whether similar members from rest of the inputs have different model predictions.	-0.005	None
Generalized entropy (GE)	Measures the inequality in benefits b assigned to each input by the model predictions.	0.015	None
Recall Difference (RD)	Measures the difference between the recall, aka true positive rate, of the model for facet values doorstep > 0.0 and rest of the inputs.	-0.004	None
Specificity difference (SD)	Measures the difference between the specificity, aka true negative rate, of the model for facet values doorstep > 0.0 and rest of the inputs.	-0.172	None
Treatment Equality (TE)	Measures the difference in the ratio of false positives to false negatives between facet values doorstep > 0.0 and rest of the inputs.	-0.080	None

Model explanations

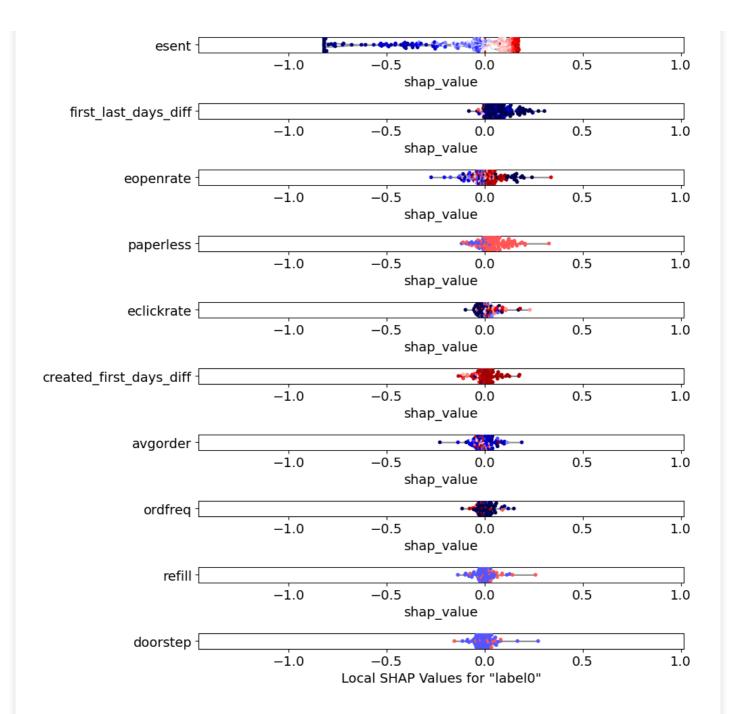

SHAP Explanations for individual labels

The model has 21 features.

We computed KernelSHAP explanations on the dataset. For each label, we display the 10° features with the greatest feature attribution. You have 1° label(s).

In the chart below, each point in the plot denotes an individual instance being explained. x-axis shows the SHAP value for the corresponding instance and feature. The red-blue color scale shows the value of the feature itself. Red indicates higher values whereas blue indicates lower values.
